

If you are the founder

You see the whole company's work and what it costs. You deliberately cannot read 1:1 notes — that is the CTO alone, and it is a decision, not an oversight.

ihelp-ops-ai-decodeds-projects.vercel.app

Nobody types how far along they are.

There is no “80% done” box anywhere in this platform, and there never will be. A task moves because something real happened: a branch appeared, a commit landed, a pull request opened, a person approved it, it merged.

You cannot fall behind by forgetting to update a status. If you did the work, the platform already knows.

You also cannot get ahead by saying you did. Nobody can, including the founder.

Your day

One person. Full reach over work and accounts; no reach over private conversations.

Morning	The digest: who moved, who was quiet, who is away. One email covering everybody, not one per person.
Analytics	Cycle time, review wait, rework, and cost per agent and per person. <i>Claimed, not proven</i> is the number worth arguing with — everything else describes the system, that one describes a gap.
Cost	Every agent run records what it spent. A run showing nothing has not reported back yet; a failure with a cost against it is money spent on work that did not ship, and is worth reading the log for.
Unblocking	Assign and reassign across every pod and repository. Any agent, any tier.
Accounts	Admin: roles, tiers, GitHub logins, and the record of every change ever made to them.

What you can do

Generated from the same file the platform enforces, so it cannot describe a permission you do not have.

Sign in and read the board, team and analytics	yes
Book and withdraw your own leave	yes
Take an unassigned task	with GitHub linked
Start a task, open a pull request, merge, comment	with GitHub linked
Dispatch agents	any
Talk to any agent about a task	yes
Read somebody else's conversation with an agent	no

Assign work to other people, and reassign	yes
Approve or reject leave	everyone
Read somebody else's leave and balance	everyone
Read a 1:1 you did not write	no
Read feedback written about somebody else	no
See who was nudged, and local editor sessions	everyone
Change roles, tiers, pods and GitHub logins	yes

Worth knowing

Chat spend shows up as chat spend. Every conversation records its tokens and cost the way an agent run does. What was said is private; what it cost is not.

You cannot read other people's 1:1 notes. The CTO alone can. If that should change it is one line in `db/schema-people-growth.sql` — a deliberate decision, made in the open, not a setting.

You cannot change your own row either. Same rule as everybody. Ask the CTO.

No hours, anywhere. There is no time-online, no presence, no session table, and there will not be. The moment those sit next to merged work, people optimise the easier number.

Talking to an agent

Every task page has a conversation. Four things about it are worth knowing before you use it.

It can read, not write

The agent sees the task, its comments and its own brief from the repository, and will read the code with you, review an approach, or say plainly that it does not know. It cannot edit a file, commit or open a pull request from the conversation. When the work needs doing, press **Run** — that dispatches the same agent into GitHub Actions, where it opens a pull request somebody reviews

It is private, and it is not the record

Nobody else can read your conversations — not your lead, not the CTO, not the founder. Nothing said in one moves a task or counts as work. If something from it matters, put it on the issue as a comment. That is the record; this is the thinking

Any agent, from your first day

Tiers decide which agents you may *dispatch*, because a dispatched agent changes code. Talking changes nothing, so you may talk to all eight — including the architect

It costs money

Each answer shows what it cost, usually a fraction of a cent. It is charged to the company like any agent run

How a task moves

Seven steps, each caused by a real thing.

10% The issue was opened — it may have no owner yet

20% A branch was created for it

40% The first commit landed on that branch

60% A pull request was opened

75% The automated checks passed

90% A human approved it

100% It was merged

A task stuck at 10% means nothing has happened — not that somebody forgot to update it.

If something looks wrong

Everything says 10%	No GitHub activity has reached the platform. The board says so rather than showing a quiet week
----------------------------	---

Merge was refused	Branch protection. A required review or check is missing — working as intended
--------------------------	--

My commits aren't showing	The commit hook isn't installed in that clone. Run <code>git config core.hooksPath .githooks</code> and push again
----------------------------------	--

There's no Take it button	Either the task already has an owner — it says who — or your GitHub account isn't linked
----------------------------------	--

The same number twice	Different tasks in different repositories. Issue numbers restart in each one
------------------------------	--

Every error in this platform says what failed and what to check. One that doesn't is worth reporting.

The handbook covering everything, for everybody, is the one to read once. This one is the part that is yours.

Questions about the platform go to the founder. Questions about a task go on the task.
