

If you run a pod

You put names on work, unblock it, and decide leave. Everything you need to do that is an artifact, not a report somebody wrote for you.

ihelp-ops-ai-decodeds-projects.vercel.app

Nobody types how far along they are.

There is no “80% done” box anywhere in this platform, and there never will be. A task moves because something real happened: a branch appeared, a commit landed, a pull request opened, a person approved it, it merged.

You cannot fall behind by forgetting to update a status. If you did the work, the platform already knows.

You also cannot get ahead by saying you did. Nobody can, including the founder.

Your day

Pod leads. Whoever is named in somebody's lead_email.

Morning

Open **Analytics**. Two numbers decide your day: *claimed*, *not proven* — tasks with a name and no artifact behind

them — and *stalled*, anything untouched for three days. Neither is a naughty list; both are a prompt to ask.

Assigning

Open work with **New task** — the description you write there is the brief an agent gets, so write it as one. Anything under “nobody’s name on it” on **Team** is unclaimed: open the task and use **Assign to...** You can also move a task off somebody who is stuck, away, or gone — that is the whole reason the power exists.

Reviewing

Pull requests waiting on a human show on each task. *Review wait* on Analytics tells you if you are the bottleneck before anybody complains about it.

Leave

Requests from your reports appear under **Waiting on you** on the Leave screen. A rejection needs a written reason — they read it on their own page.

Weekly

1:1s. What was said stays with the pair; what was agreed becomes a goal or a task and travels normally.

What you can do

Generated from the same file the platform enforces, so it cannot describe a permission you do not have.

Sign in and read the board, team and analytics	yes
--	-----

Book and withdraw your own leave	yes
----------------------------------	-----

Take an unassigned task	with GitHub linked
-------------------------	--------------------

Start a task, open a pull request, merge, comment	with GitHub linked
---	--------------------

Dispatch agents	up to your tier
-----------------	-----------------

Talk to any agent about a task	yes
--------------------------------	-----

Read somebody else's conversation with an agent	no
Assign work to other people, and reassign	yes
Approve or reject leave	your reports
Read somebody else's leave and balance	your reports
Read a 1:1 you did not write	no
Read feedback written about somebody else	no
See who was nudged, and local editor sessions	your reports
Change roles, tiers, pods and GitHub logins	no

Worth knowing

A conversation is not evidence. You cannot read your reports' conversations with agents, and that is deliberate. Judge the work by what landed. If somebody says an agent told them something, ask them to put it on the issue.

You decide leave only for your own reports. Matched on their `lead_email` being your address. The CTO and founder decide for everybody.

You cannot read a 1:1 you did not write. Not for your own reports either. Only the CTO can, and every such read appears in that person's access log.

You do not need a GitHub account to assign work. The platform assigns with its own credentials. Only *doing* the work needs a linked account.

Talking to an agent

Every task page has a conversation. Four things about it are worth knowing before you use it.

It can read, not write

The agent sees the task, its comments and its own brief from the repository, and will read the code with you, review an approach, or say plainly that it does not know. It cannot edit a file, commit or open a pull request from the conversation. When the work needs doing, press **Run** — that dispatches the same agent into GitHub Actions, where it opens a pull request somebody reviews

It is private, and it is not the record

Nobody else can read your conversations — not your lead, not the CTO, not the founder. Nothing said in one moves a task or counts as work. If something from it matters, put it on the issue as a comment. That is the record; this is the thinking

Any agent, from your first day

Tiers decide which agents you may *dispatch*, because a dispatched agent changes code. Talking changes nothing, so you may talk to all eight — including the architect

It costs money

Each answer shows what it cost, usually a fraction of a cent. It is charged to the company like any agent run

How a task moves

Seven steps, each caused by a real thing.

10% The issue was opened — it may have no owner yet

20% A branch was created for it

40% The first commit landed on that branch

60% A pull request was opened

75% The automated checks passed

90% A human approved it

100% It was merged

A task stuck at 10% means nothing has happened — not that somebody forgot to update it.

If something looks wrong

Everything says 10%	No GitHub activity has reached the platform. The board says so rather than showing a quiet week
----------------------------	---

Merge was refused	Branch protection. A required review or check is missing — working as intended
--------------------------	--

My commits aren't showing	The commit hook isn't installed in that clone. Run <code>git config core.hooksPath .githooks</code> and push again
----------------------------------	--

There's no Take it button	Either the task already has an owner — it says who — or your GitHub account isn't linked
----------------------------------	--

The same number twice	Different tasks in different repositories. Issue numbers restart in each one
------------------------------	--

Every error in this platform says what failed and what to check. One that doesn't is worth reporting.

The handbook covering everything, for everybody, is the one to read once. This one is the part that is yours.

Questions about the platform go to the founder. Questions about a task go on the task.
