

If you build things here

You take work, you do it, and the platform shows what happened. Nobody asks you for a status, ever.

ihelp-ops-live.vercel.app

Nobody types how far along they are.

There is no “80% done” box anywhere in this platform, and there never will be. A task moves because something real happened: a branch appeared, a commit landed, a pull request opened, a person approved it, it merged.

You cannot fall behind by forgetting to update a status. If you did the work, the platform already knows.

You also cannot get ahead by saying you did. Nobody can, including the founder.

Your day

Engineers, data annotators, anyone whose day produces commits.

Morning

Open the board. If something has your name on it, that is your day. If nothing does, find an unclaimed task and press **Take it** — you do not need permission, and you do not need to wait to be assigned. Found work nobody has written

down? **New task** in the header, and it becomes a GitHub issue.

Starting

Press **Start task**, open it in VS Code, and run `git config core.hooksPath .githubhooks` once per clone. That one command is what makes everything you push attach itself to the task.

Through the day

Commit and push as you go. The board moves on its own within a minute of a push — you never touch it. When the work is ready, open the pull request from the task page.

When you are stuck

Raise it in writing the same day. Label the issue `blocked` or say so in your pod channel. A block that is raised belongs to the company; a block that is not raised belongs to you.

End of day

Nothing. There is no timesheet, no standup form, no status to file. If you pushed something, it is already visible.

What you can do

Generated from the same file the platform enforces, so it cannot describe a permission you do not have.

Sign in and read the board, team and analytics	yes
--	-----

Book and withdraw your own leave	yes
----------------------------------	-----

Take an unassigned task	with GitHub linked
-------------------------	--------------------

Start a task, open a pull request, merge, comment	with GitHub linked
---	--------------------

Dispatch agents	up to your tier
-----------------	-----------------

Break a prompt into issues and open them	no
--	----

Talk to any agent about a task	yes
--------------------------------	-----

Read somebody else's conversation with an agent	no
Assign work to other people, and reassign	no
Approve or reject leave	no
Read somebody else's leave and balance	no
Read a 1:1 you did not write	no
Read feedback written about somebody else	no
See who was nudged, and local editor sessions	your own
Change roles, tiers, pods and GitHub logins	no

Worth knowing

Ask the agent before you ask a person. It has read the task and the repository, it answers in seconds, and nobody sees that you asked. It is also the fastest way to find out whether a task is bigger than it looks.

You cannot take a task somebody else holds. The platform names who has it. Go and ask them — they may be stuck, finished, or glad to hand it over.

Handing work back is normal. If a task is yours and you have not started, press **Hand it back**. No explanation owed. An honest hand-back beats a task sitting under your name for three weeks.

You own what an agent produced for you. Your name goes on the pull request. Read every line and be ready to explain it. “The agent wrote it” is not an answer, and the platform records who asked for the run.

Talking to an agent

Every task page has a conversation. Four things about it are worth knowing before you use it.

It can read, not write

The agent sees the task, its comments and its own brief from the repository, and will read the code with you, review an approach, or say plainly that it does not know. It cannot edit a file, commit or open a pull request from the conversation. When the work needs doing, press **Run** — that dispatches the same agent into GitHub Actions, where it opens a pull request somebody reviews

It is private, and it is not the record

Nobody else can read your conversations — not your lead, not the CTO, not the founder. Nothing said in one moves a task or counts as work. If something from it matters, put it on the issue as a comment. That is the record; this is the thinking

Any agent, from your first day

Tiers decide which agents you may *dispatch*, because a dispatched agent changes code. Talking changes nothing, so you may talk to all eight — including the architect

It costs money

Each answer shows what it cost, usually a fraction of a cent. It is charged to the company like any agent run

How a task moves

Seven steps, each caused by a real thing.

10% The issue was opened — it may have no owner yet

20% A branch was created for it

40% The first commit landed on that branch

60% A pull request was opened

75% The automated checks passed

90% A human approved it

100% It was merged

A task stuck at 10% means nothing has happened — not that somebody forgot to update it.

If something looks wrong

Everything says 10%	No GitHub activity has reached the platform. The board says so rather than showing a quiet week
----------------------------	---

Merge was refused	Branch protection. A required review or check is missing — working as intended
--------------------------	--

My commits aren't showing	The commit hook isn't installed in that clone. Run <code>git config core.hooksPath .githooks</code> and push again
----------------------------------	--

There's no Take it button	Either the task already has an owner — it says who — or your GitHub account isn't linked
----------------------------------	--

The same number twice	Different tasks in different repositories. Issue numbers restart in each one
------------------------------	--

Every error in this platform says what failed and what to check. One that doesn't is worth reporting.

The handbook covering everything, for everybody, is the one to read once. This one is the part that is yours.

Questions about the platform go to the founder. Questions about a task go on the task.
